

IT Staffing Lead Generation

How the System Finds & Qualifies Clients — Step by Step

Peer Consulting Group · Internal Reference · 2026

Purpose of this document: This guide explains how our automated lead generation system works — in plain language, without any technical jargon. It covers what the system does, how it searches different job platforms, what signals it looks for, and how it scores companies so the best opportunities always appear at the top.

The Big Picture

Our business is IT staffing — we place software engineers, data engineers, DevOps specialists, and other tech professionals with companies in the New York and New Jersey area. To find new clients, we need to know which companies are **actively hiring IT talent right now**. Those companies are our best leads because they already have a need and a budget.

Manually searching dozens of job boards every day is time-consuming and inconsistent. This system automates that process entirely — it searches multiple platforms simultaneously, filters out irrelevant results, investigates each company, and ranks everything from most promising to least promising so you can focus your outreach where it matters most.

The 5-Phase Process at a Glance

Phase	Name	What Happens in Simple Terms
1	Discover	Search job boards to find companies hiring IT talent in NY/NJ
2	Collect	Pull the full list of open IT roles from each company found
3	Filter	Automatically remove leads that are not relevant or worth pursuing
4	Research	Look up each company to understand its size, funding, and hiring urgency
5	Score & Present	Rank companies 0-100 and display results in an interactive dashboard

Phase-by-Phase Breakdown

1

Discover — Finding Companies That Are Hiring

AUTOMATED

The system begins by searching job boards — the same websites where companies post their open positions. Instead of just listing jobs, we use these boards as a **radar**: any company posting IT jobs in New York or New Jersey is a company we want to know about.

The system searches across four different platforms simultaneously, each of which captures a different segment of the market:

Dice.com

Broad Market — All Company Sizes

Dice is the largest IT-focused job board in the US. The system runs **10 different search queries** (such as 'Software Engineer New York', 'Data Engineer New Jersey', 'DevOps NYC', etc.) and browses through the results automatically — the same way you would manually, but much faster.

From each search, it extracts the **company names** and the roles they are advertising. This gives us a live snapshot of the market: whoever is on Dice today is actively hiring today.

Greenhouse

Mid-Size & Enterprise Tech Companies

Greenhouse is a hiring software platform used by thousands of technology companies to manage their recruitment. It has a **publicly accessible list of open jobs** for each company that uses it — no login or password required.

Once we identify a company from Dice, we automatically check if that company uses Greenhouse. If they do, we pull **all of their open IT roles** in one go. We currently monitor over **75 companies** through Greenhouse, and this list grows automatically every time we discover a new company that uses it.

Ashby

Funded Startups — Series A to Series D

Ashby is a newer hiring platform that has become very popular with funded tech startups. Companies like Ramp, Modal, Supabase, Socket, and PostHog all use Ashby to post their jobs. This is important because **funded startups are among our best potential clients** — they have money to spend on hiring and often lack a large internal recruiting team.

We currently scan **37 Ashby company boards** and pull roughly 200 IT job listings per run. Because Ashby's user base skews heavily toward well-funded startups, it is one of our richest sources of high-quality leads.

Lever

Additional ATS Coverage

Lever is another hiring platform, similar in concept to Greenhouse and Ashby. It is used by a different set of companies, so checking Lever ensures we do not miss any companies that only advertise there.

The system probes Lever for every company it discovers, adding new boards to its monitoring list automatically when found.

Wellfound (AngelList)

Startup Discovery (When Available)

Wellfound — formerly known as AngelList Talent — is a platform specifically for startups and their job listings. It is useful as a **discovery tool**: it surfaces new funded startups that we may not have found on Dice, and adds them to our monitoring list for Greenhouse, Ashby, and Lever checks.

Wellfound requires a login to access full results. When accessible, it adds additional company names to the pipeline. When unavailable, the other four platforms continue running normally.

2

Collect — Pulling All Open Roles From Each Company

AUTOMATED

Once we know which companies are hiring, the system goes back and collects the **full details of every open IT role** at each company. For each job listing, it captures:

- The **job title** (e.g. Senior Backend Engineer, Data Platform Lead)
- The **location** (New York, NJ, Remote, etc.)
- The **date the job was posted**
- A **link directly to the job posting**
- A **summary of the job description**

All of this data is stored in a structured list, grouped by company. At the end of this phase, we know exactly how many IT roles each company has open and what those roles are. A typical run collects information on **3,000 to 4,000 job listings** from across all platforms.

Why grouping by company matters: A company with 10 open IT roles is a much stronger lead than one with just 1. Bulk hiring signals urgent need — they are scaling fast and likely cannot fill all positions through their normal channels alone. The system tracks this count and uses it in scoring.

3

Filter — Removing Leads That Are Not Worth Pursuing

AUTOMATED

Not every job listing is a useful lead. Before investing time researching a company, the system automatically removes anything that clearly does not fit. There are **six automatic removal rules**:

R u l e	What Gets Removed	Why We Remove It
1	Jobs posted more than 90 days ago	The role may already be filled. Stale listings waste outreach time.
2	Jobs outside New York, New Jersey, or Remote (US)	We only place candidates in our service area. Out-of-area roles are irrelevant.
3	Job titles that are not IT roles (e.g. Sales Manager, HR Director)	We are an IT staffing firm. Non-tech roles are not our business.
4	Job descriptions that say ' No agencies ', ' No recruiters ', or ' No staffing '	The company has explicitly stated they do not want to work with staffing firms.
5	Companies we already contacted within the last 30 days	Reaching out too frequently to the same company is counterproductive.
6	Duplicate entries — the same company appearing multiple times	Each company should appear only once in the final list to avoid confusion.

Result of filtering: A typical run starts with 3,000–4,000 raw job listings and reduces this to around **50 unique, qualified companies** — each one actively hiring IT talent in our area, not having rejected agencies, and not recently contacted. This is a clean, actionable prospect list.

With a clean list of 40–60 companies, we now investigate each one to understand whether they are a **realistic, high-value client**. Just because a company is hiring IT talent does not mean they are ready to work with a staffing agency. We look at four key signals:

Signal 1 — Company Size

How many employees does this company have?

50–500 employees	SWEET SPOT	Large enough to afford agency fees (typically 15–25% of a hire's salary), but small enough that they probably do not have a large in-house recruiting department. This is the ideal profile.
Under 50 employees	TOO SMALL	Very early-stage companies may struggle to afford placement fees. We score these lower.
Over 500 employees	LIKELY HAS INTERNAL TA	Large enterprises typically have a full Talent Acquisition team. They may still use agencies occasionally, but competition is higher and they are harder to win. Scored lower.

Signal 2 — Funding Stage

Has this company recently raised venture capital or investment?

Series B or higher	STRONG SIGNAL	A Series B+ company has raised at least \$10–15M and has investor pressure to grow. They have budget, they need to scale quickly, and they are likely to pay agency fees to fill roles fast.
Series A	MODERATE SIGNAL	Earlier stage, but still has capital. Likely hiring a smaller number of key roles.
Bootstrapped or unknown funding	LOWER PRIORITY	Without external investment, budget for staffing fees is less certain. Still workable, but we prioritise funded companies first.

Signal 3 — Internal Recruiting Team

Does this company already have an in-house talent acquisition team?

No visible internal recruiters	OPPORTUNITY	If a company is actively hiring but has no dedicated internal recruiters, they are almost certainly overwhelmed. This is where we provide the most value — and where a staffing partnership is easiest to sell.
1–2 internal recruiters	POSSIBLE OPPORTUNITY	A small internal team suggests they are growing but may be stretched. Worth pursuing.
Large talent acquisition team	LOWER PRIORITY	A company with a well-staffed TA team has internal capacity. They are harder to sell to and less urgent. Scored lower.

Signal 4 — Recent News & Hiring Momentum

Is this company in a period of active growth or is there any negative news?

Active hiring push, new funding announced, rapid growth	URGENT	News of a funding round, a product launch, or explicit statements about rapid team growth are strong signals that hiring is a current priority.
Stable, normal hiring activity	NORMAL	No special urgency, but still a legitimate prospect if other signals are strong.
Layoffs, hiring freeze, or financial distress	SKIP	Companies in difficulty are not good prospects. Even if they have open roles, they are unlikely to engage a staffing firm. These are removed or heavily discounted.

5

Score & Present — Ranking Companies From Best to Worst

AUTOMATED

After researching every company, the system assigns each one a **score from 0 to 100** based on how well they match our ideal client profile. Companies are then sorted so the best opportunities always appear at the top.

The scoring is additive — points are added for positive signals and deducted for negative ones:

Signal	Points	What It Means For Us
Company has 50–500 employees	+20	Ideal size — has budget, likely needs outside help
Series B+ / well-funded	+20	Capital exists to pay placement fees
No visible internal recruiter	+15	They need external recruiting support
3 or more open IT roles	+15	Multiple hires = higher revenue potential per client
New York / New Jersey location	+10	Within our service area
Niche or specialised tech stack	+10	Harder roles to fill = more reliant on specialists
Urgency signals or rapid growth	+10	Active hiring push means immediate need
Large internal TA team found	–20	They have in-house capacity to recruit
No funding and fewer than 50 employees	–10	Budget risk — may not be able to afford fees

Urgency Labels

Each company also receives an urgency label based on their score and how recently the roles were posted:

■ HIGH	Score 60 or above AND roles posted within the last 21 days	Contact immediately — strong need, roles are fresh
■ MEDIUM	Score 40 or above, OR roles posted within 30 days	Good prospects — follow up within the week
■ LOW	Everything else	Lower priority — research more before outreach

The Dashboard

All scored and ranked companies are displayed in an **interactive dashboard** — a single file that opens in any web browser. The dashboard lets you:

- View all leads sorted by score, with HIGH urgency companies at the top
- Filter by minimum score (e.g. show only companies scoring 60+)
- Filter by urgency level (HIGH / MEDIUM / LOW)
- Search by company name or job title
- Click directly through to any job posting or the company's LinkedIn page
- See the full score breakdown explaining exactly why a company scored how it did

What a great lead looks like in practice: A fintech startup in Manhattan with 150 employees, a recent Series B funding round, 8 open engineering roles posted this week, and no visible recruiting team on LinkedIn. Score: 80. Urgency: HIGH. This is a company that needs engineers now, has the money to pay for them, and has no one internally to find them. That is our call to make.

What to Do With the Results

The pipeline is designed so that by the time you open the dashboard, the hard work is already done. Here is a suggested approach to working through the leads:

Step	Action	Who to Target
1	Start with HIGH urgency, score 70+ companies	Decision maker in Engineering or Operations (CTO, VP Engineering, Head of Engineering)
2	Review the open roles and score breakdown for each company	Use the role titles to personalise your outreach — mention what they are hiring for
3	Check the LinkedIn link provided in the dashboard	Verify the hiring manager and check whether they have worked with agencies before
4	Move to MEDIUM urgency, score 50–69 after the first tier	These are still strong prospects but less immediately urgent
5	Mark contacted companies so they are skipped in the next run	Prevents the system from showing you the same company again within 30 days

Important — What the System Does Not Do

This system is a **prospecting and qualification tool**, not a sales tool. It finds and ranks companies for you, but it does not send emails, make calls, or contact anyone on your behalf. All actual outreach remains with you. The system simply ensures that when you do reach out, you are talking to the right companies at the right moment.

The system also does not guarantee that every lead will convert — it surfaces the **highest-probability opportunities** based on publicly available signals. Human judgement is still needed to evaluate fit, personalise outreach, and close the relationship.

Target Profile Summary

Criteria	Our Sweet Spot	Rationale
Company size	50–500 employees	Has budget, lacks full internal TA team
Funding stage	Series B, C, D or recently funded	Capital available to pay placement fees
Industry	Tech, Fintech, Biotech, HealthTech, SaaS	Heavy IT hiring needs, familiar with agency model
Geography	New York, New Jersey, Remote (US)	Our service and candidate network area
Roles needed	Software Eng, Data Eng, DevOps, ML, Cloud, SRE	Our core placement specialisations
Recruiting setup	No large internal TA team	They rely on external help to fill roles
